Variable Naming Exercises

In the following exercises declare all your variables with `const` unless you are told otherwise

- 1. City Temperature for a Weather App** In a weather application, you need to store the current temperature of a city named "Paris". Name the variable in a way that it's clear what data it holds and which city it refers to. Remember to use camel case.
- 2. User Login Status for a Website** For a website's user authentication system, you need to keep track of whether a user is logged in or not. Choose a variable name that clearly indicates this boolean status. The convention of naming boolean variables is to start the name with `is`.
- 3. Customer's Email Address in an Order Form** In an online order form, you're storing a customer's email address. Choose a variable name that indicates whose email it is and that it's coming from a form.
- 4. Total Score in a Basketball Game** You are keeping track of the total score in a basketball game. Choose a name for this variable that makes it clear it's about the score in a Basketball Game context.
